

Patient-Level Registry Data

20+
years of registry
experience

55+
epidemiologists
and statisticians

over **1000**
clinical publications

License our registry data to gain greater insights into the patient phenotypes and their significant impact on the answers to your most complex research questions.

These patient-level data across six longitudinal autoimmune registries enable detailed characterization of disease subgroups. Our granular regulatory-grade data, with over 98.5%* completeness, provide invaluable insights and fill the data gaps left by other sources.

Our registry data can be leveraged by your teams directly or linked to other acquired datasets, including claims and EMR, generating deeper clinical insights and a better understanding of how physician decision-making, treatment outcomes, and healthcare utilization are influenced by disease phenotype.

Heterogeneity among patients impacts clinical prognosis, response to therapy, and long-term outcomes.

Our data include the following characteristics:

- Deep demographics and lifestyle characteristics (including race, education, work status, BMI, smoking, and alcohol use)
- Disease duration
- History of disease
- Number of prior treatments
- Disease manifestation and location
- Disease severity measures
- Patient-reported symptoms
- Work productivity impact scores

*Preselected variables are 98.5% complete
